Subject: Application for Data Architecture & Software Development Role

Dear Sabrina Guffler,

Please accept my application for the Software Development and Data Architecture position at meteocontrol. With a strong background in building highly available backend systems and real-time data streaming architectures, I am very excited about the opportunity to contribute to meteocontrol's mission in the renewable energy sector.

As a Lead Engineer and Systems Architect, I have extensive experience designing scalable data infrastructures. At Lunar Finance, I architected high-throughput backend routing services and RPC indexers in Rust and PostgreSQL that processed over \$1M+ in daily trading volume, reducing cross-chain latency by 40%. This required a deep analytical mindset and the ability to process extremely large datasets efficiently.

Furthermore, my work as Lead Embedded Engineer at NodeX iHub directly aligns with your need for data streaming and IoT. I designed real-time data ingestion pipelines using WebSockets, MQTT, and C/C++ firmware to bridge physical hardware (like sensor-driven farm irrigation systems) with cloud dashboards. I am highly proficient in modern deployment pipelines, embracing a "you build it, you own it" mentality using Docker, AWS, and Fastlane CI/CD.

While my primary stacks heavily feature Go, Rust, and Node.js, my experience with diverse ecosystems allows me to adapt quickly to environments utilizing Kotlin, PHP, or any time-series database your infrastructure demands.

Please note that I am a Nigerian citizen currently based in Lagos, and I would require employer sponsorship for a work visa/permit to relocate to Germany. I am highly motivated, ready to relocate, and eager to bring my expertise in robust data pipelines to your team.

Thank you for your time and consideration. I look forward to the possibility of discussing how I can help drive the future of renewable energies with meteocontrol.

Sincerely,

Collins Krubu Osemudiamé
