Application for a Fullstack Developer position (Frontend focus) – Remote

Dear SEITENBAU team (Hello Andre, Jonas and Marie),

I came across your open position as a Fullstack Developer and was immediately impressed by your focus on agile processes, open source and socially relevant software projects.

As a full-stack developer with over four years of proven experience (especially with React, Next.js, and TypeScript), I don't just build isolated features, but complete end-to-end solutions. A concrete example is my platform **Lupply**, for which I, as the sole developer, built the frontend (React/Next.js), the backend, the CI/CD pipelines (Fastlane/GitHub Actions), and the cloud infrastructure. This experience is a perfect fit for your needs in frontend architecture, test automation, and accessible (a11y) applications.

Regarding your backend stack: My previous focus was on Node.js, Go, and high-performance systems in Rust (e.g., for Lunar Finance, a DEX aggregator with 350,000 users). I am a polyglot developer and am currently very motivated to learn the **Java/Spring Boot** ecosystem. My deep understanding of system architecture and backend routing makes this technological shift very easy for me. Furthermore, I actively integrate AI-powered tools into my workflow, which perfectly aligns with your interest in artificial intelligence in software development.

Regarding my language skills: I speak fluent English (native speaker), which is very helpful for me in technical architecture and documentation within the team. My German is currently at A1 level, but I am studying intensively every day to reach B1/B2 as quickly as possible.

I am used to working completely independently, asynchronously and remotely, but am happy to be available for in-person meetings from Berlin.

Please find my CV attached. I would be delighted to have the opportunity to demonstrate in an interview how I can strengthen your cross-functional team.

Sincerely,

Collins Krubu
